

BAND OF AGENTS HACKATHON

# RSoft Agentic Bank

**A bank run by AI agents — on Band**

Six AI agents collaborate in a shared chat room to verify, approve, and disburse real USDC loans on-chain — every decision recorded.

**Track 3 · Regulated & High-Stakes Workflows**

## THE PROBLEM

# One AI can't run a bank

A bank cannot let a single AI approve loans on its own. It needs a committee — separated roles, checks and balances, and a clear record of who decided what.

But today, most AI agents work alone — locked in one app, one framework, unable to talk to each other or to humans.

## THE SOLUTION

# An autonomous credit committee

Six specialized AI agents collaborate through Band — a shared chat room for AI. They hand off work by @mentioning each other.

Turn Band off and the flow stops — the disbursement happens because the CFO approved it in the room. Band is the coordination, not a wrapper.

## ARCHITECTURE — TWO LAYERS

### **BAND — the coordination layer**

A shared chat room. Agents discover each other and hand off work via @mention.  
Each agent = a LangGraph ReAct loop (GPT-4o + tools), connected via band-sdk.

↓ **agents call the bank over REST**

### **RSoft Agentic Bank backend — the lending logic**

FastAPI + LangGraph + Supabase. Runs KYA, credit scoring, treasury checks,  
and the real ERC-20 USDC transfer on Base Sepolia.

**Band moves the messages between agents · the bank API does the work · the agent is the bridge.**

## THE SIX AGENTS

### **Borrower**

Requests a loan and signs terms

### **Gatekeeper**

KYA / identity verification, recruits the committee

### **Analyst**

Credit score, default probability, recommended terms

### **CFO**

Approves or denies funding against treasury liquidity

### **Settler**

Executes the real USDC disbursement on Base Sepolia

### **Auditor**

Explainable verdict over the full workflow (audit trail)

**PROOF — REAL MONEY ON-CHAIN**

# Not simulated. Verifiable.

A full committee run disburses real USDC on Base Sepolia, and the Auditor closes each case with the score, the approval, the settlement tx hash and the block number.

## **Example disbursement — BaseScan (Base Sepolia)**

0xabc25ce0bae88d2b2735b0e59b51bd71334fa3bb3089e7f14da0466556c3a24e

**5 USDC · treasury -> borrower · status: SUCCESS**

## WHY IT MATTERS

# The future is a team of agents

### Application of tech

Band is the real coordination layer for handoffs.

### Business value

Traceable, role-separated credit for regulated lending.

### Originality

Real on-chain money, cross-layer Band <-> LangGraph.

### Presentation

A verifiable on-chain transaction backs the demo.

**Not one AI doing everything — a team of specialized agents running a bank.**
